"Mor, gi' mig solen."

Pladask Elektrisk is celebrating summer with overused literary references of syphilis induced insanity. The aftermath of a workshop at LydEksperimentKlubben, Trondheim; SOLEN is a lofi delay with features perfect for making your instrument sound all good and fucked, well-baked by the sun.

TIME – *Delay Time*
Delay time of delay 2. Can be short and pleasant, or slow and textured.

MOD – *Selfmodulation*
Adds selfmodulation to delay 1 (similar to the Romferd SMOD).

D. LVL – *Delay Level*
Volume of the delay effect. This is not a dry/wet mixer.

FEED – *Delay Feedback*
From a single repeat to runaway oscillation. Higher FEED and MOD settings will drastically reduce the signal-noise ratio in a feverish manner. The feedback switch will momentarily max out the delay feedback. Depending on your parameter settings the FEED knob will need to be dialed past 9 o'clock to get the wanted effect from the momentary switch.

RES – *Resonance*
Adds a tap for the first delay (~40ms delay). Turning up the FEED knob will give you resonant delay repeats.

WET – *Wet Only*
Cuts out the dry sound.
